Ball Screens

S. Howes Ball Screens produce excellent material separation for maximum production without using expensive-to-maintain brushes. Screens are cleaned by the continual bouncing action of resilient balls against the underside of the screen surface. The constant agitation aids particle stratification and prevents screen blinding for more efficient cleaning – even when used with materials which tend to clog easily.

- S. Howes ball screen designs ensure product quality
- Perforated plate or wire mesh available
- Dove-tailed and glued wood frame construction provides an extended screen life, typically twice that of normal screens
- Removable perforated plate options available
- Eliminates need for daily adjustment
- Can replace S. Howes brush systems
- Metal Frames – for sanitary & other applications

Available with perforated plate only, metal frames provide an alternative to wood frames where material contact with wood is not desired

Wood Frames

Available with perforated plate or wire mesh, wood frames are reusable – allowing for replacement of screening surface area without replacing wood frames. Dove-tailed and glued wood frame construction provides an extended screen life, typically twice that of normal screens

Stretch Screens – for sanitary & other applications

For special applications where product contact does not allow for mild steel or wood. Typically stretch screens are a stainless steel mesh fastened by a S. Howes hook based assembly
